

- Ten cards, 35 minutes, your own repository. Pick freely, in any order, **at least two. Card 4 for everyone:** it is the render test for the release before lunch.
- Your questions from the morning: 1 is the one you know the answer to, 2 the one you do not, 3 the one your data cannot answer.

1. The question you cannot answer yet

Ask your question 2 and watch what it assumes without asking.

Answer the following question using the data in this repository and add the result to the manuscript: *your question 2*.

Watch for: what it assumes without asking. Does it name the assumption?

2. The question the data cannot answer

Ask your question 3. Does it say the data cannot answer it, or does it make something up?

Answer the following question using the data in this repository: *your question 3*.

Watch for: does it say the data cannot answer it, or does it produce an answer anyway? Ask for receipts: which file, which column.

3. The codebook

Ask it to describe every file in data/ and write a codebook, one row per variable.

Describe every file in data/. Then write a codebook for the main table as a CSV with one row per variable: name, type, unit, description.

Watch for: where it puts the codebook and what it calls it. Would a colleague find it?

4. One figure, rendered (recommended)

Ask for one figure for your question 1 in the manuscript, then render it to DOCX.

Add one figure that answers *your question 1* to the manuscript, with the plot code in a chunk, and render the manuscript to DOCX.

Watch for: whether it renders. If it does not, this is the moment to find out, not at the release. Raise your hand.

5. Five references

Ask it for the five most relevant references in your Zotero library.

Find the five references in my Zotero library that are most relevant to this data, and say in one sentence each why.

Watch for: does it read the library through the Zotero tool, or does it guess titles? Check one. If the tool returned nothing: did it go around the tool, and did it ask you first?

6. The README, read by a stranger

Ask what a new colleague would not understand in your README.

Read the README and tell me what a new collaborator would not understand about this repository. Do not change anything.

Watch for: does it read, or does it flatter? Is anything it names actually missing? Nothing to commit.

7. What does it know right now

Type `/context`, then ask what it has read and what it has not. Type `/context`. Then:

What do you know about this repository right now, and what have you not read?

Watch for: the size of the context and what is in it. The answer should match the list. Nothing to commit.

8. Name the tool

Ask it to use `git log` to tell the history of your repository in five lines.

Use `git log` to tell me the history of this repository in five lines.

Then try another tool by name: read a file, list a folder, run a command.

Watch for: the tool call line before each answer. Nothing to commit.

9. The same task twice

Start a new session and run card 1 again, word for word. What changed?

Type `/exit`, then `claude`, then card 1 again, word for word.

Watch for: what differs between the two runs. Which one would you merge? Commit the one you would.

10. Wild card

Ask anything you are curious about.

Watch for: your own reaction. Write it on the day sheet.
